

ABSTRACT OF THE INVENTION

The present invention is to provide an electronic pilot ignition with safety switch comprising a hollow body, a safety switch installed freely on the center of the hollow body, a pedestal on the safety switch and a brake bar inside a slide slot of the pedestal to move right or left in the slide slot, wherein the top of the brake bar exposes to the pedestal and the bottom of the brake bar stretches horizontally to an indentation slot of the hollow body to have the indentation slot block the brake bar, so that the safety switch can not be moved forward. A brake component is installed freely in an open slot of the pedestal near the brake bar, the brake component can be moved forward or backward inside the open slot and wedges to one of the open slot of the brake bar.
